

MFG Global Opportunities (USD)

AS AT 30 JUNE 2026

PORTFOLIO MANAGERS

ALAN PULLEN, PORTFOLIO MANAGER

RYAN JOYCE, CFA, DEPUTY PORTFOLIO MANAGER

INVESTMENT PHILOSOPHY

To invest in outstanding companies at attractive prices, while exercising a deep understanding of the macroeconomic environment to manage investment risk.

OBJECTIVE

To outperform the MSCI World Net Total Return Index net of fees over periods of three years or longer.

PORTFOLIO CONSTRUCTION

A portfolio of 20-40 investments which we believe can achieve sufficient diversification to ensure the Fund is not overly correlated to a single company, or to industry specific or macroeconomic risks. The portfolio aims to invest in companies that have sustainable competitive advantages which translate into returns on capital in excess of their cost of capital for a sustained period of time. Cash and cash equivalents exposure between 0 - 5%.

PERFORMANCE CHART GROWTH OF USD \$10,000 (NET)²

Past performance is not a reliable indicator of future performance.

¹ Comprised of all Global Equity strategies.

² Returns are for the Global Opportunities Composite ("composite") and denoted in USD. Performance would vary if returns were denominated in a currency other than USD. Refer to the GIPS Disclosure section below for further information. Strategy inception is 1 January 2022. Composite (Net) returns are net of fees charged to clients and have been reduced by the amount of the highest fee charged to any client employing that strategy during the period under consideration. Actual fees may vary depending on, among other things, the applicable fee schedule and portfolio size. Fees are available upon request.

³ The data is based on a representative portfolio for the Global Opportunities Strategy. Refer to the Glossary for further information on representative portfolio use.

⁴ Please refer to the Glossary for definitions.

* Outperformance consistency indicates the percentage of positive excess returns against the benchmark (MSCI World NTR USD Index) for rolling 3 year returns since inception.

* Benchmark is the MSCI World Net Total Return Index (USD). All MSCI data used is the property of MSCI. No use or distribution without written consent. Data provided "as is" without any warranties. MSCI and its affiliates assume no liability for or in connection with the data. Please see complete disclaimer in

⁵ The data is based on a representative portfolio for the Global Opportunities Strategy. Sectors are internally defined. Geographical exposure is calculated on a look through basis based on underlying revenue exposure of individual companies held within the portfolio. Exposures may not sum to 100% due to rounding. Refer to the Glossary for further information on representative portfolio use.

⁶ The contribution highlight table is actual performance data of a representative portfolio within the Global Opportunities Composite. Contributions are denoted in USD and are cumulative for each period. Refer to the Glossary for further information on representative portfolio use. The securities identified above do not represent all the securities purchased, sold or recommended for Magellan Investment Partners clients in connection with the Global Opportunities Strategy. The Global Opportunities Strategy's total returns are available on request.

⁷ Supplementary Statistical Measures are calculated after fees in USD against the MSCI World NTR USD Index.

GLOSSARY

Beta A measure of the composite's sensitivity to market movements, with the market defined as the MSCI World NTR USD Index. The beta of the market is 1.00 by definition. A beta greater than 1.00 suggests the composite is more volatile than the market, a beta less than 1.00 indicates the composite has lower volatility than the market and a beta of 1.00 suggests the composite has the same level of volatility as the market.

Carbon Intensity A measure of the metric tonnes of CO₂ released per \$1mil USD revenue of a company. Calculated as a weighted average of all stocks in the representative portfolio.

Contribution The contribution values at the security level comprise the sum of each security's daily contribution to the return of the total portfolio multiplied by total portfolio growth over the remainder of the prescribed period (i.e. 1 year, 5 years and 10 years). The daily contribution is the movement in the security price multiplied by the security weight in the portfolio.

Debt/Equity Ratio A measure of a company's financial leverage calculated by dividing its net debt by stockholders' equity. Calculated as a weighted average of all stocks in the representative portfolio.

Information Ratio Is a risk-adjusted return measure that calculates the composite return above the benchmark (MSCI World NTR USD Index), relative to the volatility of those returns. Measured by excess return over the tracking error.

Interest Cover Current year earnings before interest and tax divided by net interest expense – a measure of ability to service debt. Calculated as a weighted average of all stocks in the representative portfolio.

P/E Ratio (1 year rolling forward) The share price divided by a forecast of earnings per share in one year. Calculated as a weighted average of all stocks in the representative portfolio.

Representative Portfolio The representative portfolio is an account in the composite that closely reflects the portfolio management style of the strategy. Performance is not a consideration in the selection of the representative portfolio. The characteristics of the representative portfolio may differ from those of the composite and of the other accounts in the composite. Information regarding the representative portfolio and the other accounts in the composite is available upon request.

Return on Equity A measure of a company's profitability that takes a company's annual net income divided by the book value of its shareholder equity. Calculated as a weighted average of all stocks in the representative portfolio.

Standard Deviation measures how widely individual performance returns, within the composite, are dispersed from the average or mean value.

Turnover A measure of the representative portfolio's trading activity, which is calculated by taking the lesser of purchases or sales and dividing by the average net assets of the measurement period.

Tracking Error Calculated as the standard deviation of the difference between the return of the composite and its benchmark (MSCI World NTR USD Index) and used as a measure of relative consistency of performance to the benchmark.

Weighted average market cap (USD Million) The average market capitalisation of all companies in the representative portfolio, with each company weighted according to its percent held.

IMPORTANT INFORMATION

This material is not intended to constitute advertising or advice of any kind and you should not construe the contents of this material as legal, tax, investment or other advice. In making an investment decision, you should read and consider any relevant offer documentation applicable to any investment product or service and must rely on your own examination of the same and consider obtaining professional investment advice tailored to your specific circumstances before making any investment decision.

The investment program of the strategy or strategies presented herein ('**Strategy**') is speculative and may involve a high degree of risk. The Strategy is not intended as a complete investment program and is suitable only for sophisticated investors who can bear the risk of loss. The Strategy may lack diversification, which can increase the risk of loss to investors. The Strategy's performance may be volatile. Past performance is not necessarily indicative of future results and no person guarantees the future performance of the Strategy, the amount or timing of any return from it, that asset allocations will be met, that it will be able to implement its investment strategy or that its investment objectives will be achieved. Statements contained in this material that are not historical facts are based on current expectations, estimates, projections, opinions and beliefs and such statements involve known and unknown risks, uncertainties and other factors, and undue reliance should not be placed thereon. This material may contain 'forward-looking statements'. Actual events or results or the actual performance of the Strategy or any financial product or service may differ materially from those reflected or contemplated in such forward-looking statements. The Strategy will have limited liquidity, no secondary market for interests in the Strategy is expected to develop and there are restrictions on an investor's ability to withdraw and transfer interests in the Strategy. The management fees, incentive fees and allocation and other expenses of the Strategy will reduce trading profits, if any, or increase losses.

The MSCI World Index (Net) is a free-float adjusted market capitalization weighted index that is designed to measure the equity performance of 24 developed markets. Index results assume the reinvestment of capital gain and net investment income using a tax rate applicable to non-resident institutional investors who do not benefit from double taxation treaties.

GLOBAL INVESTMENT PERFORMANCE STANDARDS (GIPS®) DISCLOSURE

Magellan Asset Management Limited, doing business as Magellan Investment Partners ('Magellan') claims compliance with the Global Investment Performance Standards (GIPS®).

For the purpose of complying with GIPS, the Firm is defined as all discretionary portfolios managed by Magellan, excluding brands managed by subsidiaries operating as distinct business entities. Magellan is a wholly-owned subsidiary of the publicly listed company Magellan Financial Group Ltd. Magellan is based in Sydney, Australia. Total Firm assets is defined as all assets managed by Magellan, excluding assets managed by subsidiaries operating as distinct business entities.

The Global Opportunities composite is a concentrated global equity strategy investing in high quality companies (typically 20-40 stocks). High quality companies are those companies that have sustainable competitive advantages which translate into returns on capital materially in excess of their cost of capital for a sustained period of time. The investment objectives of the Global Opportunities strategy are to earn superior risk adjusted returns through the business cycle. The composite name changed from Global Unconstrained to Global Opportunities June 2024. The composite was created in February 2022..

To achieve investment objectives, the composite may also use derivative financial instruments including, but not limited to, options, swaps, futures and forwards. Derivatives are subject to the risk of changes in the market price of the underlying securities instruments, and the risk of the loss due to changes in interest rates. The use of certain derivatives may have a leveraging effect, which may increase the volatility of the composite and may reduce its returns.

A copy of the composite's GIPS compliant presentation and/or the firm's list of composite descriptions are available upon request by emailing client.reporting@magellanfinancialgroup.com.

GIPS® is a registered trademark of CFA Institute. CFA Institute does not endorse or promote this organization, nor does it warrant the accuracy or quality of the content contained herein.

The representative portfolio is an account in the composite that closely reflects the portfolio management style of the strategy. Performance is not a consideration in the selection of the representative portfolio. The characteristics of the representative portfolio may differ from those of the composite and of the other accounts in the composite. Information regarding the representative portfolio and the other accounts in the composite is available upon request.

GLOBALOPPORTUNITIESUSD46203

Market Commentary

Global share prices, as measured by the MSCI World Index, rose sharply in the June quarter of 2026, rising by 13.8% in USD terms. Further appreciation of the AUD (+1.2% against the USD) trimmed the gain modestly for domestic investors, leaving the index up 12.5% in AUD. The quarter marked a reversal of the stagflationary narrative that dominated in March. As the US–Iran conflict de-escalated and the threat to shipping through the Strait of Hormuz receded, energy prices fell sharply, with WTI crude declining 31.4%. The real market action for the quarter was in chip stocks and other perceived data centre expansion beneficiaries, with price moves in the more speculative corners of the market extreme. The Philadelphia Semiconductor Index (SOX) surged around 88% over the quarter, its largest quarterly gain on record, surpassing those of the dot-com bubble era. This was led by memory and storage names on expectations of continued shortages. The likes of Micron (+242%), Intel (+216%), Marvell Technology (+201%) and AMD (+186%) all posted extraordinary moves. Notably, these moves were driven as much by momentum-chasing as by fundamental repricing and left valuations stretched heading into the second half. The rally in semiconductor stocks resulted in returns for the quarter being dominated by the Information Technology sector (+33.8%), followed by Industrials (+12.7%), Financials (+12.3%) and Consumer Discretionary (+9.1%). The previous quarter's defensive and inflation-protected winners lagged, with Energy (-13.1%) the weakest sector as oil collapsed, while Utilities (+0.4%), Materials (+1.8%) and Consumer Staples (+2.0%) all trailed.

Across regional markets, performance reflected exposure to the two reversing forces of the period: the technology rebound and the energy retreat. Japan's Nikkei 225 was the standout, surging 37.3% as relief on imported energy costs reinforced domestic reflation. Emerging markets (+24.1% in USD) also rallied strongly. The tech-heavy US led the developed markets, with the Nasdaq gaining 21.5% and the S&P 500 15.1%. Europe's STOXX 600 (+11.4%) and Germany's DAX (+10.2%) posted solid gains, while China's CSI 300 rose 12.7% on continued policy support. Australia's S&P/ASX 200 Accumulation Index was the notable laggard, up just 4.0%, held back by its heavy weighting to resources and defensives and limited exposure to the technology names driving the global rally.

The macro backdrop improved over the quarter, but not without complications. Falling oil prices on the back of progress on a US–Iran deal took much of the heat out of the inflation scare that defined March and shifted the mood from stagflation fears towards a more manageable slowdown. That said, the all-clear was far from clean: some energy costs, notably gas, remained elevated, and the durability of the peace deal is not assured. More importantly for investors, economic activity proved resilient: the US, Europe, Australia and China all delivered steady-to-firmer data while inflation stayed sticky. The upshot was a hawkish shift in interest-rate expectations: markets moved to price rate hikes rather than cuts in both the US and Australia, a notable reversal from earlier in the year, and government bond yields rose in the US as growth and inflation surprised on the upside. For markets, the quarter was ultimately a story of relief that the worst-case energy shock was avoided, tempered by the recognition that resilient growth and persistent inflation keep central banks cautious.

Strategy Commentary

The strategy delivered a positive return for the quarter but significantly underperformed the benchmark that is increasingly driven by bubble-like conditions in semiconductors and other perceived data centre supply chain beneficiaries. Bubbles can unwind rapidly, and we remained disciplined around portfolio construction aiming to reduce the risk of permanent capital loss and build long-term wealth.

The largest contributors to the portfolio's performance over the quarter were TSMC, UnitedHealth Group and Adidas. TSMC is a beneficiary of both AI chip investment and the data centre expansion cycle. In response to strong AI chip demand, TSMC raised its 5-year revenue growth CAGR by 5 points to 25% pa. While the growth will be supported by a large step up in FY26 capex (benefiting semi cap vendors like ASML), TSMC also raised its long-term gross margin guidance, signalling confidence in its ability to drive productivity, cost efficiencies and pricing power. UnitedHealth recovered from depressed levels due to a strong 1Q result with the medical care ratio improving to 83.9% (from 84.8% a year earlier), prompting management to raise FY26 adjusted EPS guidance. The result reflected a prioritisation of margin recovery over membership growth, including trimming Medicare Advantage membership and restoring operational discipline at Optum Health. Softer industry-wide medical cost and utilisation trends and a larger-than-proposed 2027 Medicare Advantage rate increase further supported sentiment. Adidas delivered a strong 1Q earnings result at the end of April that demonstrated broad-based brand momentum across sports performance and lifestyle products, continuing market share gains and margin expansion. Strong execution of brand and marketing initiatives throughout the 2Q26 FIFA World Cup has further increased market confidence in near-term sales results, cash generation and brand momentum.

Key detractors included Intuit, Netflix and Intercontinental Exchange (ICE). Intuit performed poorly on a combination of i) broad market concerns regarding the disruption of incumbent software providers, and ii) specific concerns related to its tax business where competition at the low end led to a small miss against guidance. We continue to view Intuit's SMB platform in QuickBooks as resilient to AI disruption and more than underpinning Intuit's current market valuation. Concerns about its tax business are more warranted, with consumer price sensitivity this tax season highlighting the impact a disruptive AI offering could have. That said, Intuit's tax business is increasingly driven by more complicated tax offerings that should be more resilient. Netflix has given up a lot of the gains following its rally after walking away from its bid for Warner Bros Discovery. This was driven by a combination of a more positive macro outlook and higher interest rates (Netflix is viewed as defensive) and limited near-term engagement growth in the US. We view the latter as largely a short-term issue driven by a strong sporting calendar and growth in engagement of short video due to improvements in algorithms. We continue to view Netflix as well-placed to maintain its position as the dominant streaming platform for professional content and grow profits strongly over the medium term. ICE was affected by a combination of i) broad concerns about the disruption of software by AI that applies to a small part of its

business, ii) a decline in exchange energy volumes as the US and Iran reached a ceasefire, iii) US approval of perpetual futures for bitcoins and a stated willingness to consider additional asset classes and iv) a more resilient macro outlook and associated higher rates, which affects valuation and volumes in its mortgage business. We consider these concerns misplaced in aggregate and ICE as well-positioned to grow earnings at a healthy rate over time. With respect to perpetual futures and prediction markets, we consider the risks to ICE to be very low given limited exposure to retail trading and equities.

Index movements and stock contributors/detractors are based in local currency terms unless stated otherwise.

We are entering a dangerous period for markets. Over the past year or so the great promise of AI has morphed from being sensibly priced into markets based on fundamental opportunities and threats to a speculative bubble, driven by easy gains, price momentum and fear of missing out (FOMO). Exuberance in the genuine benefits of AI has moved from rational to irrational as initial gains have driven increased retail participation and passive flows, often into leveraged, short-term "bets". This has resulted in remarkable moves in a relatively narrow group of semiconductor companies and other perceived beneficiaries of data centre expansion, which assumes current elevated profitability will not only be sustained at record levels but continue to expand. All other fundamentals, from geopolitical turmoil and elevated inflation to growing government debt levels, have been largely proven irrelevant to market performance, such has become the dominance of the AI thematic.

Manias of this kind can persist longer than valuation alone would suggest, and we make no attempt to call their timing, but history is consistent on the outcome for those who buy into crowded, richly priced leadership late in its run. We would rather forgo the final stretch of a move we cannot underwrite than expose capital to permanent loss when sentiment turns. Our discipline here is deliberate, and it is unchanged: we regard the companies we own as high-quality businesses with durable earnings growth, and we insist on paying sensibly for them.

The good news is the narrowness of the market's leaders has left many companies neglected, and quality franchises outside the favoured themes are now available at valuations that imply expected returns among the most attractive we have seen since the post-Covid period. This is the opportunity we are focused on. Mindful of a backdrop of resilient activity and still-elevated inflation, we are using the market's preoccupation with a single theme to add selectively to businesses where we anticipate strong long-term compounding in earnings, cash flows and value – companies whose worth is undiminished even as attention is directed elsewhere.

Stock Story: Meta

(Ryan Joyce - Deputy Portfolio Manager)

Founded in 2004 as Facebook, Meta Platforms has grown into one of the most widely used communication and media networks in history. Its Family of Apps – Facebook, Instagram, WhatsApp and Threads – now reaches more than 3.5 billion people every day, an audience without real precedent in scale or daily engagement. Alongside Alphabet, Meta sits at the centre of the global digital advertising market, the destination where a meaningful share of the world's attention, and therefore advertising budgets, is spent.

While durable economic moats are rare in consumer technology, where platforms can rise and fall quickly, we believe Meta's are unusually deep. Powerful network effects make its apps more valuable to each user as more people join; an enormous base of first-party engagement data allows it to match advertisers to audiences with a precision few rivals can replicate; and the sheer scale of its infrastructure and ad system creates cost and capability advantages that are difficult to challenge. Importantly, Meta reinvests heavily to defend and extend these advantages and has repeatedly shown an ability to adapt its products as consumer behaviour shifts, most recently in the pivot to short-form video.

What attracts us today is that artificial intelligence, widely feared as a disruptive threat across the technology sector, is already delivering tangible returns inside Meta's core business. Over recent years the company has rebuilt its recommendation and ranking systems around increasingly sophisticated AI models. The effect is visible across the platform: better algorithms have lifted engagement, with time spent and video watch time rising across both Facebook and Instagram; more dynamic approaches to ad delivery have increased ad load and impressions per hour of engagement; and improved targeting, together with lower content-creation costs for advertisers, has allowed for higher ad prices without eroding the returns advertisers earn. The result has been a re-acceleration of revenue growth into the mid-to-high twenties. Critically, this was achieved with comparatively modest incremental spend, which is to say it was the cheap part. The benefits continue to compound as the models improve.

This cash generation, combined with the natural operating leverage of the platform, is being reinvested into a second and altogether more ambitious set of AI initiatives – the expensive part. Here, Meta is spending heavily to build frontier models through Meta Superintelligence Labs and the recently released Muse family. The market largely treats this as an ongoing cost, but we see it as a portfolio of very cheap options, which together could materially expand Meta's addressable market or lower its cost base. A frontier model is valuable internally and is also licensable to third parties, opening a route to API revenue of the kind earned by OpenAI and Anthropic. Personal and business agents could embed Meta's apps even more

deeply into users' daily lives (a phrase that should perhaps come with a warning label) while creating fresh monetisation paths, from commission structures to premium, high-compute tiers for those who want the AI to try harder. Non-advertising services for the creators and businesses already on the platform, early signs of which include the rapid scaling of business AIs, offer a way to diversify revenue away from advertising. And in hardware, Meta's AI glasses are emerging as a best-in-class platform, with the number of daily users tripling year-on-year, an encouraging early signal of consumer adoption.

Every enduring investment case has its area of debate, and for Meta it is the scale, and occasional exuberance, of this investment. Capital expenditure guidance continues to rise, and the absolute numbers are large. However, at roughly 17 times forward earnings for a category-dominant business growing revenue above 20%, the market appears to be capitalising these AI investments into perpetuity as pure cost, while extending Meta no credit at all for the revenue or profit they might ultimately produce. We do not think that is a coherent medium-term position, particularly given Mark Zuckerberg's track record. He has proven willing to invest aggressively where it is necessary to protect the franchise or where the return potential is real; however, as the "year of efficiency" demonstrated, he has also shown himself to be highly rational, even ruthlessly focused on growing the value of the business, and quick to retrench when spending fails to earn its keep.

We therefore see an unusually attractive asymmetry. Either these investments generate a meaningful return (and Meta's vast, deeply engaged user base is about as natural a distribution advantage as exists in technology) or management pulls back on them, as it has before. If we strip out the non-core AI investment, we estimate Meta could be earning operating margins close to 50%, against the roughly 35% expected in 2026. On that basis the shares trade closer to 12 times forward earnings, which we regard as very good value for a business of this quality, scale and durability.

We remain conscious of the risks. The most serious is the potential for significant legal liability arising from the platform's impact on adolescent mental health, an area of ongoing litigation and regulatory scrutiny. We are also alert to the possibility of regulation that fundamentally degrades the appeal of Meta's services to adult users, and to the risk that management remains committed to heavy near-term AI spending in a sharply deteriorating economic environment, which would pressure returns at precisely the wrong time.

On balance, however, we believe Meta represents a compelling long-term opportunity: a category-dominant advertising franchise, demonstrably able to convert AI into profit within its core business, available at a price that asks us to pay for almost none of the optionality that its investment is creating. That combination of proven quality, durable competitive advantages and an undemanding valuation supports its place as a high-quality, long-duration holding within a global equity portfolio.
